# What is AgroVIR?

AgroVIR is an innovative management information software which supports decision making processes through complex change of approaches, so that I can farm in a reliable way, achieving development that lies on continuous professional bases, requiring the least time and energy input.

AgroVIR is an independent actor on the market, helping farmers with cloud-based solutions.

HUNGARY

320.000 ha

SLOVAKIA

10.000 ha

ROMANIA

30.000 ha

## Organic Growth

Our company has grown organically since the beginning, it has become a significant actor not only in the Hungarian agricultural market. Beyond being one of the national representatives of innovative solutions, it has international partners and solutions as well.

## Up-to-date cost data

The question of costs is always a sensitive point. You need to know how much you spend on what and how far you can go in order to make profit. There are many factors in agriculture that you cannot influence: weather, prices of crops, prices of input materials, however, recording costs in an up-to-date way only depends on you!

## Decision-making based on data

AgroVIR backs up all the points of your farm with data: it summarizes information, makes it transparent, because we want to see the whole, as well as the many small details!

## Data follow-up on field level

Information coming from each field enables much deeper and serious analyses than information from sector level. Important details always lie in the depth of the field.

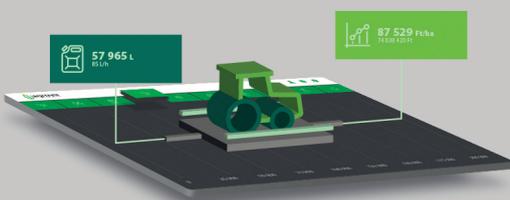

## Putting an end to paper-based administration

If someone records their data into a digital system, they can use digital technology in a case a problem arises. By using a programme or mobile application with AgroVIR software, you will be able to find the answers, no matter what happens on your field.

## Integrated into the agrovir system: digital bridge-scale and fuel station.

We have integrated two basic devices into the system, which are essential for every farmer, and the data coming through them require a huge amount of work afterwards: bridge scale and fuel station.

## Stock management

Keeping track of stocks and documenting changes get more and more complicated with the growth of a company. It is not enough to be correct, but the processes have to be transparent, so that they can provide us with up-to-date data.

## There's no need for separate recordings

If we need to do administrative work, let it not only be precise, but comfortable as well! Data need to be recorded only once, they will appear everywhere we need them. Later we can specify or change them, but the recording needs to be done only once!

## Automatic warnings

Based on recorded data, AgroVIR makes a summary and reflects, furthermore, sends out a warning at the appropriate time in fields that are considered important for us.

## Writing optional reports

Creating accounts in an up-to-date way and correctly – in the minimum time, avoiding more days of preparation and data harmonization.

## Geoinformatics

We identify geoinformatics with maps: we see our lands on the map, or even machines working on them. With the AgroVIR system it's a bit more – imagine data and their correlations for a certain field on the map.
